Early Access Paper

AirNote is the currency layer built to work with AirStore. It is not a specific currency, but rather a system for creating digital currencies. A particular feature is that it can support multiple currencies each with their own value, that are very easy to convert from one to the other.

AirNote is essentially AirStore with extra features that make it suitable for managing currencies. It operates using the same basic principles as AirStore but with some additional features.

The AirNote Ecosystem is made up of Nodes, however they have additional features compared with AirStore Nodes so we call them Exchanges to differentiate between AirNote Exchanges and general AirStore Nodes. It is worth knowing that an AirNote Exchange also has all the features and capabilities of an AirStore Node and can function as an AirStore Node if it is useful to do so.

AirNote is currently in development and is intended to be a usable system, sometime in 2028.
