# AirNote

## Early Access Paper

The currency layer built to work with AirStore. It is not a specific currency, but rather a data format for managing currencies. A particular feature is that it can support multiple currencies each with their own value, that are very easy to convert from one to the other.

AirNote is essentially AirStore with extra features that make it suitable for managing currencies. It operates using the same basic principles as AirStore but with some additional features to make it performant for managing currencies.

The AirNote Ecosystem is made up of Nodes, however they have additional features compared with AirStore Nodes so we call them Exchanges.

AirNote Currencies are essentially Networks of Exchanges. Further information about what this means specifically will be provided in time as the development work progresses.

AirNote is currently in development and is intended to be a usable system, sometime in 2028.
